

# Be Safe This Summer!

Never take a barbecue grill or stove inside a tent, or caravan, to cook or use as a heat source.

Portable and disposable barbecues, including stoves with a flame, can be dangerous even when cooling or smouldering. They emit large quantities of carbon monoxide (CO) which is a lethal gas that can kill within a few minutes.

## Carbon Monoxide

**You cannot see it,  
smell it or taste it!**

**Yet, it can kill!**

**If you suspect carbon monoxide, call 112 or the emergency services in your country IMMEDIATELY.**

Barbecue grills and stoves can be very dangerous!

Only cook in an open and ventilated part of the field or garden.

Make sure that you cook a safe distance away from your tent or caravan.

Special thanks to ANEC - The European consumer voice in standardisation, Consumer Safety International (CSI) and all those who have supported this campaign to raise awareness about the danger of carbon monoxide poisoning.
